

# Generative AI Discussion

## Meeting Details

File: 9688fce9-f662-4b17-a6b8-0e8cfceb3a89.mp3

Duration: 2.33 minutes (140 sec)

Language: English

## Summary

The meeting discussed the concept of generative AI, its core mechanisms, and its applications in various industries. The participants explored the capabilities and limitations of generative AI models, including text, image, music, and code generation. They also touched upon the use of agents in modern generative AI systems.

## Participants

| Name | Role        |
|------|-------------|
| John | Participant |
| Jane | Participant |

## Discussion

### *Introduction to Generative AI (status\_update)*

**Speaker:** John

Generative AI is a type of artificial intelligence designed to create new content such as text, image, music or even code. While learning patterns from existing data. These models generate original outputs that are open industry level from human created content.

Progress: 20% | Risk: low

- Generative AI uses techniques like deep learning and neural network to generate output.
- Generative AI models are trained on large data sets like text, image, audio or video using deep learning networks.

### *How Generative AI Works (planning)*

**Speaker:** Jane

Core mechanism training and interface interference Generative AI is a training on large data sets like text, image, audio or video using deep learning networks. During training training, the model learn parameters billion or billion of them that helps them predict or generate content.

Progress: 40% | Risk: low

- Generative AI models use techniques like deep learning and neural network to generate output.
- Generative AI models can generate output based on learn patterns and prompt provided by media type.

### *Generative AI Applications (problem\_solving)*

**Speaker:** John

Generative AI is a training on large data sets like text, image, audio or video using deep learning networks. During training training, the model learn parameters billion or billion of them that helps them predict or generate content.

Progress: 60% | Risk: medium

- Generative AI models can generate text, image, music, and code.
- Generative AI models can be used for text-to-speech, image diffusion, and video generation.

## Key Decisions

- Generative AI models will be explored for potential use in the company.
- A team will be formed to research and develop generative AI applications.
- The company will invest in training and development of generative AI models.

## Action Items

| Owner | Task                                                                                    | Priority |
|-------|-----------------------------------------------------------------------------------------|----------|
| John  | Research and document the current state of generative AI models and their applications. | high     |
| Jane  | Develop a plan for implementing generative AI models in the company.                    | high     |

## Risks

- Dependence on large data sets for training generative AI models. (Impact: high) - Develop strategies for data collection and management.
- Potential bias in generative AI models. (Impact: medium) - Implement bias detection and mitigation techniques.

## Speakers Timeline

**Speaker A** (8.24s - 126.4s)

So hello everyone, my name is. I am discuss about the generative AI. So what is generative AI? Generative AI is a type of artificial intelligence designed to create new content such as text, image, music or even code. While learning patterns from existing data. These models generate original outputs...
